

What ADDLYFT makes

Read this file first. The other two files are extra detail.

One short brief from a store or brand becomes two ads. Same voice on both.

- Speakers: a 15-second spoken ad between songs (like a radio / Spotify ad — not a song).
- Store TV: a 10-second video with big readable offer text.
- Same person talking on both. Quiet licensed music under the voice.

What plays in the store

Left: Ceiling speakers with timeline

SONG 2:00
0:00 2:00 2:15 ...

Right: TV on wall playing 10s video of Maaza bottle with readable text

CHILLED MAAZA

maaza

Same campaign. | Audio 15s on speakers. | Video 10s on TV. Same voice file used in the video.

How one ad is made

Five steps. Always in this order.

- Write the words (speaker lines, TV lines, a social caption).
- Check the words. Bad copy never uses the rented computer.
- Make the 15-second speaker file (voice + quiet music).
- Make the TV file using that same voice (big text on top).
- Play: speakers between songs, TV on the wall.

ADDLYFT A to Z — one ad

Names — what each word means

If a picture says a tool name, look it up here.

Plain name	Tool name	What it does
Writer	Gemini	Writes the words
Voice tool	VoxCPM2	Reads the script out loud
Mixer	FFmpeg	Adds quiet music and cuts to 15.000 seconds
Motion tool	Wan	Turns a product photo into a short moving clip
Ad editor	Remotion	Puts big text + the voice onto the TV video
Rented computer	RTX 4090	The machine that runs voice and motion, one job at a time

You do not pick Wan or Remotion. You use both. Wan moves the product. Remotion adds the offer text.

One rented computer

Voice jobs and TV-motion jobs take turns.

One 4090 for both APIs (development)

- We rent one RTX 4090 (~\$0.34 per hour) and turn it off when nobody is using it.
- Voice and motion cannot run at the same moment on this card. One waits.
- About \$41–\$55 a month if we use it 6–8 hours × 20 days.

What we build now

Do not promise anything outside the green box.

Locked stack for development

Now: speaker ads, TV ads with readable text, optional product motion, one rented computer.

Not now: songs, singing, instant TV video, or a giant model trained from zero.

Build order

- Week 1 — one speaker ad that sounds right after a real song. One TV template on dummy audio.
- Week 2 — one moving product clip inside that TV template.
- Week 3 — both requests on the one-computer waiting line.
