

TV ads

The 10-second video on the store screen

The TV shows big offer text, maybe a moving product, and the same voice as the speakers.

Not a choice. Both. Wan = camera. Remotion = editor.

- Motion tool can make a product photo move. It will not write "20% OFF" clearly.
- Ad editor puts real text on top and exports the file the TV plays. No photo is still fine.

Voice first. Then video.

Order is mandatory

**Never generate video before audio.
Sync will break.**

- The voice file is the clock. Make it first.
- If video is made before voice, the TV and the speakers will not match.

One example

One Maaza ad — what each tool makes

Developer owns Remotion templates and Wan LoRA later. Do not ask Wan to write the offer.

- A = the voice. B = the moving product (optional). C = what the store TV actually plays.
- C is the only file the TV needs. Motion takes minutes — a waiting line, not instant.

What the TV actually shows

Final ad = layers.
If text is on Wan, it will look wrong.

- Shoppers must read the offer from the aisle. That is why text is real type, not AI-drawn letters.
- If the words are hard to read on a real TV, we fix the editor — we do not change the motion tool.

This phase

What we actually ship in development

YES	NO
✓ New video for every approved ad ✓ Audio and video same length ✓ Readable offer text via Remotion ✓ Optional Wan motion from product photo ✓ Later: LoRA on our approved ads	✗ Not a ChatGPT-scale video model from scratch ✗ Wan will not reliably draw prices/text ✗ Not realtime (Wan takes minutes) ✗ Not singing / lip-sync to lyrics ✗ Not Sora/Veco as the company-owned core

If it is not in **YES**, do not promise it.

Now: a new TV file per approved ad, length from the voice, readable text, optional motion.

Not now: instant video, singing, lip-sync, or asking the motion tool to draw prices.
